Timecode Calculator for Windows

Calculating with timecode is not always a trivial task. What is for example 25min divided by 5 frames? Hmmm...

Couple of years ago Peter D. Gray created FreeTime, one of the best Timecode Calculator that can add, subtract, divide and multiply any one of a number of different timecode/edgcode formats.

A truly remarkable software but the only problem is that it was written for PALM Pilot.

I needed to do some chapter point conversion for [DVD-lab project](#) and this calculator was the only reason the old Palm IIIe didn't end-up in basement inside some box labeled "garage sale".

The PALM Pilot version is still available on Peter D. Gray [page](#).

Windows Remake

I contacted Peter and we agreed that I can make a windows version. So here it is, my own version of FreeTime Timecode Calculator based on the original PALM Pilot version with some of my modifications.

Two Modes

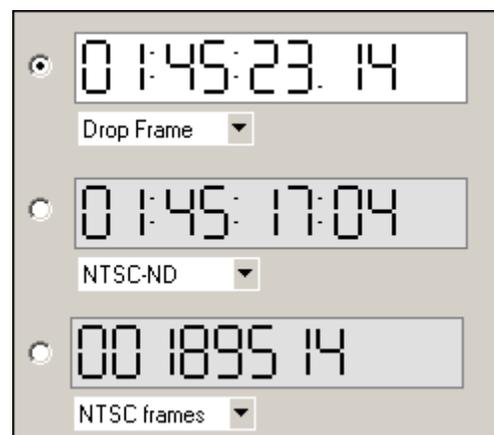

There are two modes: Conversion mode and Editing Mode. In both modes you can use the calculator functions. To switch from one mode to another, press the button on the left top corner:

Conversion mode

This is the default mode. Here you can convert between different timecode formats. Each of the three fields can be set to a different format and either may be selected for user input.

- 1 Conversion: enter timecode to the selected input (mouse or keyboard) and press '=' or Enter. The two other displays will show the converted data.
- 1 It also works like a regular calculator: enter digits (a timecode), press +, -, /, x and enter more digits. Equals will show the answer in all three displays.

Editor Mode

In this mode all three displays are

This software is great for [Video Editors](#), [DVD authors](#) or Directors of photography (here the PALM version comes handy)

Features

- | Works like a regular calculator but on timecode
- | Frame accurate calculations
- | Support conversion and calculation with Drop Frame, NTSC-ND (Non-drop), PAL, NTSC frames, PAL frames, Film frames (24 fps), 30fps frames, Real-time, 16mm, 35mm, 16mm/20 (20 frames per keycode aka foot).
- | Has editor mode for In, Out and Duration calculation
- | Small footprint and clean interface

using the same timecode format and each display is used for IN, OUT and DURATION editing. One of the displays can be set to Auto calculation the reminding two need to be set.

In the image above I set the duration to be calculated. Then entering IN time, OUT time and pressing Enter will calculate the duration. I can set for example OUT as calculated, then I need to set IN time and Duration to see what would be the OUT time.

Download

My Win-FreeTime is 100% free, same as Peters PALM version.
